

TrustBridge — UI/UX Architecture & Design Specification

Production-Grade Design System, Information Architecture, and Anti-AI Polish Guidelines

1. Visual Grammar: "Institutional Fintech"

To ensure TrustBridge feels like an auditable financial platform (analogous to Binance, Groww, or Kickstarter) rather than a generic Web3 prototype, it employs high data density, hairline boundaries, monospace financial figures, and explicit micro-states.

Design Token	Hex Code	Tailwind Class	Role & Behavioral Intent
Canvas Base	#0B0E14	slate-950	Deep slate navy canvas. Eliminates oversaturated neon tones.
Surface Card	#121721	slate-900	Primary container for data cards, pitch summaries, and tables.
Elevated Surface	#1A2130	slate-800	Modal overlays, transaction drawers, sticky order boxes.
Structural Border	#262F40	border-slate-800	Hairline separators (1px solid rgba(255,255,255,0.08)).
Primary / Success	#10B981	emerald-500	Healthy states, active funding, milestone approvals.
Protocol / Web3	#3B82F6	blue-500	Sepolia network pills, tx hashes, contract links.
Warning / Review	#F59E0B	amber-400	Review Needed , partial evidence, cap approaching.
Critical / Alert	#EF4444	rose-500	Reverted transactions, anomalous metrics, failed goals.

2. Page Routing & Information Architecture

The user interface is segmented into six dedicated functional views:

- `/` — **Institutional Landing Page**: Protocol telemetry, live event ticker, and 4-step escrow visualizer.
- `/explore` — **Campaign Marketplace**: Category filters, ML risk scores, and dual progress indicators (Goal vs. Hard-Cap).
- `/campaigns/:id` — **Escrow Command Center**: 60/40 layout isolating campaign narrative from the financial Web3 terminal.
- `/campaigns/create` — **Creator Pitch Studio**: Multi-step form structuring deliverables and milestone tranches.
- `/dashboard/creator` — **Creator Operations**: Vault overview, evidence upload drawer, and tranche withdrawal triggers.
- `/verifier` — **Audit Chamber**: Clean workbench for authorized signers to review AI checklists and approve tranches.

3. Deep Dive: Campaign Details Escrow Chamber (60/40 Split)

Left Column (60%) — Evidence & Verification

1. Campaign Narrative & Specs: Embedded pitch, BOM hardware list, and creator identity verification badge.

2. AI Decision Support Card:

- Model success probability score calculated at launch time.
- Structural risk assessment highlighting budget realism.
- Mandatory disclaimer: *Advisory AI analysis only; not a legal fraud verdict.*

Right Column (40%) — Sticky Order Terminal

Live Contract Telemetry:

- Raised: **14.50 ETH** / Cap: **20.00 ETH**
- Remaining: **5.50 ETH**
- Sepolia Contract: **0x7B2a...4Fa1**

Hard-Cap Guarantee

3. Staged Escrow Timeline:

- **Tranche 1 (20%):** Released immediately upon reaching 10 ETH goal.
- **Tranche 2 (25%):** Firmware and PCB layout deliverable.
- **Tranche 3 (25%):** Bench test validation and integration proof.
- **Tranche 4 (30%):** Final delivery & public release.

Funds sent beyond 20 ETH are automatically split and refunded by the contract in the same block.

Action Panel:

- Amount input with chip presets (+0.5, +1.0, Max).
- Primary button: **Contribute ETH.**
- Secondary action: **Request Refund** (auto-enabled if project fails).

4. UX Details That Eliminate the "AI-Made" Feel

- **Monospace Alignment for Financial Figures:** ETH balances, wallet addresses, and gas costs must strictly render in monospace font (`font-mono`) to prevent visual jitter during live updates.
- **Four-State Transaction Flow:** Replace browser popups with an in-app drawer displaying: (1) *Signature Requested* → (2) *Broadcast to Mempool* → (3) *Block Mined* → (4) *Confirmed / Reverted*.
- **Skeleton Data Loading:** Use pulsing slate bars (`bg-slate-800 animate-pulse`) instead of generic rotating spinners when querying contract or API states.
- **Hairline Boundaries:** Create visual depth using crisp 1px borders (`border-slate-800/80`) rather than diffuse floating shadows.
